Today

- Using semaphores to schedule shared resources
 - Producer-consumer problem
 - Readers-writers problem
- Other concurrency issues
 - Thread safety
 - Races
 - Deadlocks

Using Semaphores to Coordinate Access to Shared Resources

- Basic idea: Thread uses a semaphore operation to notify another thread that some condition has become true
 - Use counting semaphores to keep track of resource state.
 - Use binary semaphores to notify other threads.
- Two classic examples:
 - The Producer-Consumer Problem
 - The Readers-Writers Problem

Producer-Consumer Problem

Common synchronization pattern:

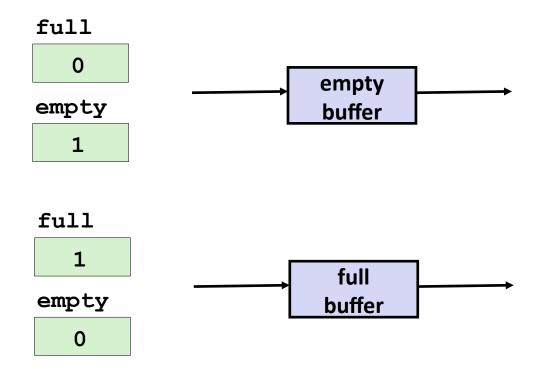

- Producer waits for empty slot, inserts item in buffer, and notifies consumer
- Consumer waits for item, removes it from buffer, and notifies producer

Examples

- Multimedia processing:
 - Producer creates video frames, consumer renders them
- Event-driven graphical user interfaces
 - Producer detects mouse clicks, mouse movements, and keyboard hits and inserts corresponding events in buffer
 - Consumer retrieves events from buffer and paints the display

Producer-Consumer on 1-element Buffer

Maintain two semaphores: full + empty

Producer-Consumer on 1-element Buffer

```
#include "csapp.h"

#define NITERS 5

void *producer(void *arg);
void *consumer(void *arg);

struct {
  int buf; /* shared var */
  sem_t full; /* sems */
  sem_t empty;
} shared;
```

```
int main(int argc, char** argv) {
 pthread t tid producer;
 pthread t tid consumer;
  /* Initialize the semaphores */
  Sem init(&shared.empty, 0, 1);
  Sem init(&shared.full, 0, 0);
  /* Create threads and wait */
  Pthread create (&tid producer, NULL,
                 producer, NULL);
  Pthread create (&tid consumer, NULL,
                 consumer, NULL);
  Pthread join(tid producer, NULL);
  Pthread join(tid consumer, NULL);
  return 0;
```

Producer-Consumer on 1-element Buffer

```
Initially: empty == 1, full == 0
```

Producer Thread

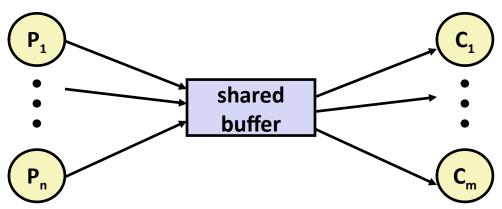

```
void *producer(void *arg) {
  int i, item;
  for (i=0; i<NITERS; i++) {
    /* Produce item */
    item = i:
   printf("produced %d\n",
            item);
    /* Write item to buf */
    P(&shared.empty);
    shared.buf = item;
    V(&shared.full);
  return NULL;
```

Consumer Thread

```
void *consumer(void *arg) {
  int i, item;
  for (i=0; i<NITERS; i++) {
    /* Read item from buf */
    P(&shared.full);
    item = shared.buf;
    V(&shared.empty);
    /* Consume item */
    printf("consumed %d\n", item);
  return NULL;
```

Why 2 Semaphores for 1-Entry Buffer?

Consider multiple producers & multiple consumers

- Producers will contend with each to get empty
- Consumers will contend with each other to get full

Producers

```
P(&shared.empty);
shared.buf = item;
V(&shared.full);
```

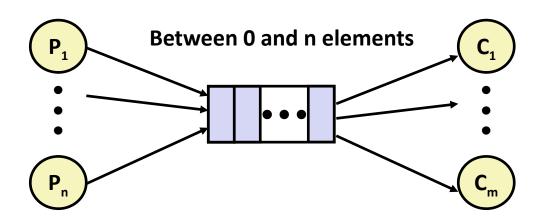

Consumers

P(&shared.full);
item = shared.buf;
V(&shared.empty);

Producer-Consumer on an *n*-element Buffer

Implemented using a shared buffer package called sbuf.

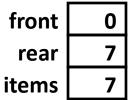

Circular Buffer (n = 10)

- Store elements in array of size n
- items: number of elements in buffer
- Empty buffer:
 - front = rear
- Nonempty buffer
 - rear: index of most recently inserted element
 - front: (index of next element to remove 1) mod n
- Initially:

front	0	0	1	2	3	4	5	6	7	8	9
rear	0										
items	0										

Circular Buffer Operation (n = 10)

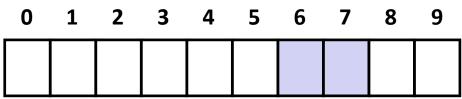

Insert 7 elements

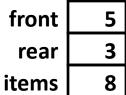

0	1	2	3	4	5	6	7	8	9

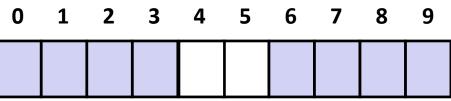

Remove 5 elements

front	5
rear	7
items	2

Insert 6 elements

Remove 8 elements

front	3
rear	3
items	0

0	1	2	3	4	5	6	7	8	9

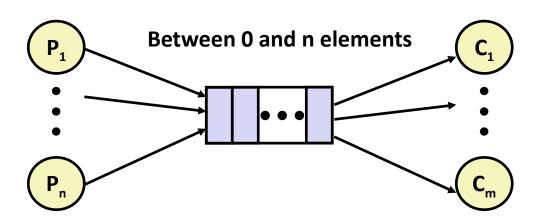

Sequential Circular Buffer Code

```
init(int v)
{
   items = front = rear = 0;
}
```

```
insert(int v)
{
    if (items >= n)
        error();
    if (++rear >= n) rear = 0;
    buf[rear] = v;
    items++;
}
```

```
int remove()
{
    if (items == 0)
        error();
    if (++front >= n) front = 0;
    int v = buf[front];
    items--;
    return v;
}
```

Producer-Consumer on an *n*-element Buffer

- Requires a mutex and two counting semaphores:
 - mutex: enforces mutually exclusive access to the buffer and counters
 - slots: counts the available slots in the buffer
 - items: counts the available items in the buffer
- Makes use of general semaphores
 - Will range in value from 0 to n

sbuf Package - Declarations

```
#include "csapp.h"
typedef struct {
   int *buf; /* Buffer array
   int n; /* Maximum number of slots
   int front;  /* buf[front+1 (mod n)] is first item
                                                      */
   int rear;  /* buf[rear] is last item
                                                      */
   sem t mutex; /* Protects accesses to buf
                                                      */
   sem t slots; /* Counts available slots
                                                      */
   sem t items; /* Counts available items
                                                      */
} sbuf t;
void sbuf init(sbuf t *sp, int n);
void sbuf deinit(sbuf t *sp);
void sbuf insert(sbuf t *sp, int item);
                                                    sbuf.h
int sbuf remove(sbuf t *sp);
```

sbuf Package - Implementation

Initializing and deinitializing a shared buffer:

```
/* Create an empty, bounded, shared FIFO buffer with n slots */
void sbuf init(sbuf t *sp, int n)
    sp->buf = Calloc(n, sizeof(int));
                               /* Buffer holds max of n items */
    sp->n = n;
    sp->front = sp->rear = 0; /* Empty buffer iff front == rear */
    Sem init(&sp->mutex, 0, 1); /* Binary semaphore for locking */
    Sem init(&sp->slots, 0, n); /* Initially, buf has n empty slots */
    Sem init(&sp->items, 0, 0); /* Initially, buf has zero items */
/* Clean up buffer sp */
void sbuf deinit(sbuf t *sp)
   Free(sp->buf);
                                                                  sbuf.c
```

sbuf Package - Implementation

Inserting an item into a shared buffer:

```
/* Insert item onto the rear of shared buffer sp */
void sbuf insert(sbuf t *sp, int item)
{
                               /* Wait for available slot */
   P(&sp->slots);
                               /* Lock the buffer
   P(&sp->mutex);
                                                           */
   if (++sp->rear >= sp->n) /* Increment index (mod n) */
       sp->rear = 0;
   sp->buf[sp->rear] = item; /* Insert the item
                                                           */
   V(&sp->mutex);
                              /* Unlock the buffer
                                                           */
   V(&sp->items);
                               /* Announce available item */
                                                          sbuf.c
```

sbuf Package - Implementation

Removing an item from a shared buffer:

```
/* Remove and return the first item from buffer sp */
int sbuf remove(sbuf t *sp)
    int item;
                               /* Wait for available item */
   P(&sp->items);
                               /* Lock the buffer
   P(&sp->mutex);
                                                           */
    if (++sp-)front >= sp-)n /* Increment index (mod n) */
       sp->front = 0;
    item = sp->buf[sp->front];  /* Remove the item
                                                           */
                              /* Unlock the buffer
   V(&sp->mutex);
                                /* Announce available slot */
   V(&sp->slots);
    return item;
                                                             sbuf.c
```

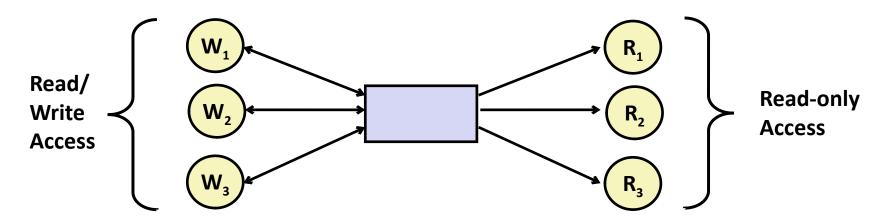

Demonstration

- See program produce-consume.c in code directory
- 10-entry shared circular buffer
- 5 producers
 - Agent i generates numbers from 20*i to 20*i 1.
 - Puts them in buffer
- 5 consumers
 - Each retrieves 20 elements from buffer
- Main program
 - Makes sure each value between 0 and 99 retrieved once

Today

- Using semaphores to schedule shared resources
 - Producer-consumer problem
 - Readers-writers problem
- Other concurrency issues
 - Thread safety
 - Races
 - Deadlocks

Readers-Writers Problem

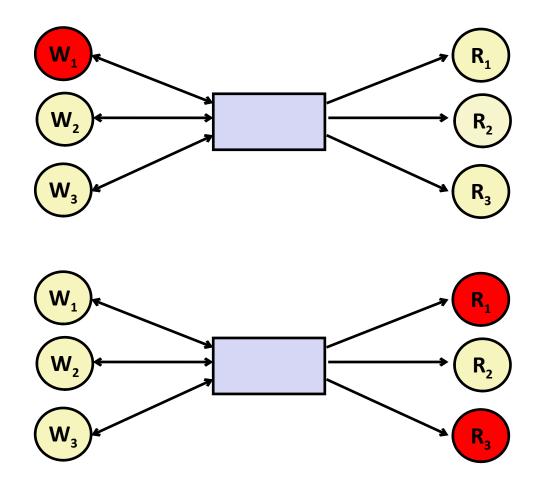

Problem statement:

- Reader threads only read the object
- Writer threads modify the object (read/write access)
- Writers must have exclusive access to the object
- Unlimited number of readers can access the object

Occurs frequently in real systems, e.g.,

- Online airline reservation system
- Multithreaded caching Web proxy

Readers/Writers Examples

Variants of Readers-Writers

- First readers-writers problem (favors readers)
 - No reader should be kept waiting unless a writer has already been granted permission to use the object.
 - A reader that arrives after a waiting writer gets priority over the writer.
- Second readers-writers problem (favors writers)
 - Once a writer is ready to write, it performs its write as soon as possible
 - A reader that arrives after a writer must wait, even if the writer is also waiting.
- Starvation (where a thread waits indefinitely) is possible in both cases.

Readers:

```
int readcnt; /* Initially 0 */
sem t mutex, w; /* Both initially 1 */
void reader(void)
 while (1) {
   P(&mutex);
    readcnt++;
    if (readcnt == 1) /* First in */
     P(&w);
   V(&mutex);
    /* Reading happens here */
    P(&mutex);
    readcnt--;
    if (readcnt == 0) /* Last out */
     V(\&w);
   V(&mutex);
```

Writers:

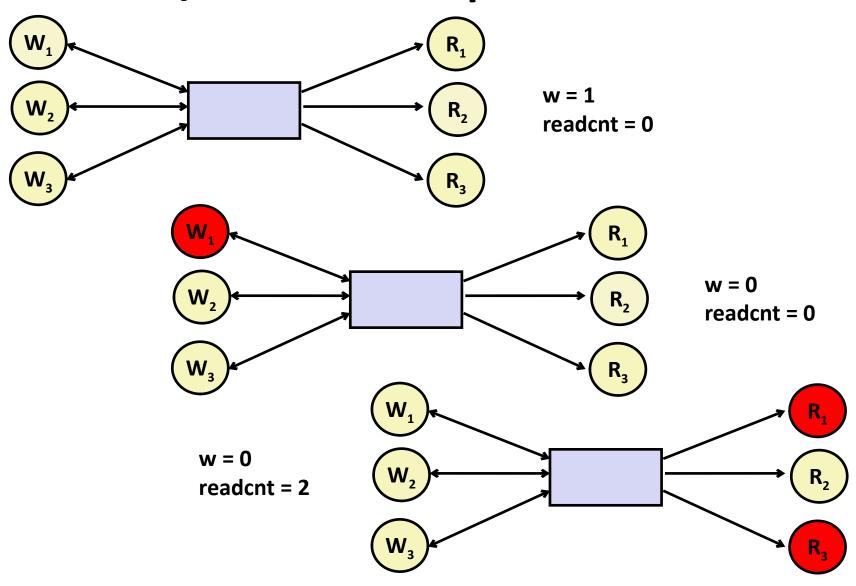

```
void writer(void)
{
  while (1) {
    P(&w);

    /* Writing here */

    V(&w);
}
```

rw1.c

Readers/Writers Examples

Readers:

```
int readcnt; /* Initially 0 */
sem t mutex, w; /* Both initially 1 */
void reader(void)
 while (1) {
   P(&mutex);
    readcnt++;
    if (readcnt == 1) /* First in */
     P(&w);
   V(&mutex);
    /* Reading happens here */
    P(&mutex);
    readcnt--;
    if (readcnt == 0) /* Last out */
     V(\&w);
   V(&mutex);
```

Writers:

```
void writer(void)
{
   while (1) {
     P(&w);

   /* Writing here */

   V(&w);
}
```

Readcnt == 0 W == 1

Other Versions of Readers-Writers

Shortcoming of first solution

Continuous stream of readers will block writers indefinitely

Second version

- Once writer comes along, blocks access to later readers
- Series of writes could block all reads

FIFO implementation

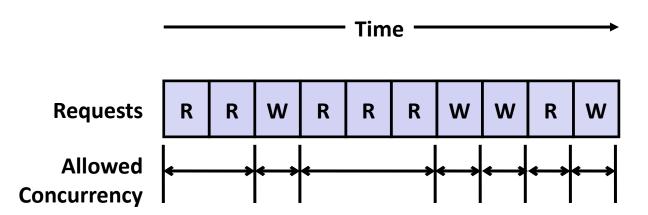

- See rwqueue code in code directory
- Service requests in order received
- Threads kept in FIFO
- Each has semaphore that enables its access to critical section

```
sem t rmutex, wmutex, r, w; // Initially 1
void reader(void)
 while (1) {
   P(&r);
   P(&rmutex);
   readcnt++;
   if (readcnt == 1) /* First in */
   P(&w);
   V(&rmutex);
   V(&r)
   /* Reading happens here */
   P(&rmutex);
   readcnt--;
   if (readcnt == 0) /* Last out */
     V(&w);
   V(&rmutex);
```

Solution to Second Readers-Writers Problem Void Writer (Void)

```
void writer(void)
  while (1) {
    P(&wmutex);
    writecnt++;
    if (writecnt == 1)
        P(&r);
    V(&wmutex);
    P(&w);
    /* Writing here */
    V(&w);
    P(&wmutex);
    writecnt--;
    if (writecnt == 0);
        V(&r);
    V(&wmutex);
```

Managing Readers/Writers with FIFO

Idea

- Read & Write requests are inserted into FIFO
- Requests handled as remove from FIFO
 - Read allowed to proceed if currently idle or processing read
 - Write allowed to proceed only when idle
- Requests inform controller when they have completed

Fairness

Guarantee very request is eventually handled

Readers Writers FIFO Implementation

Full code in rwqueue.{h,c}

```
/* Queue data structure */
typedef struct {
    sem_t mutex; // Mutual exclusion
    int reading_count; // Number of active readers
    int writing_count; // Number of active writers
    // FIFO queue implemented as linked list with tail
    rw_token_t *head;
    rw_token_t *tail;
} rw_queue_t;
```

Readers Writers FIFO Use

In rwqueue-test.c

```
/* Get write access to data and write */
void iwriter(int *buf, int v)
    rw token t tok;
    rw queue request write(&q, &tok);
    /* Critical section */
    *buf = v;
    /* End of Critical Section */
    rw queue release(&q);
                            /* Get read access to data and read */
                             int ireader(int *buf)
                                 rw token t tok;
                                 rw queue request read(&q, &tok);
                                 /* Critical section */
                                 int v = *buf;
                                 /* End of Critical section */
                                 rw queue release(&q);
                                 return v;
```

Library Reader/Writer Lock

- Data type pthread_rwlock_t
- Operations
 - Acquire read lock

```
Pthread rwlock rdlock (pthread rw lock t *rwlock)
```

Acquire write lock

```
Pthread_rwlock_wrlock(pthread_rw_lock_t *rwlock)
```

Release (either) lock

```
Pthread_rwlock_unlock(pthread_rw_lock_t *rwlock)
```

Observation

- Library must be used correctly!
 - Up to programmer to decide what requires read access and what requires write access

Today

- Using semaphores to schedule shared resources
 - Producer-consumer problem
 - Readers-writers problem
- Other concurrency issues
 - Thread safety
 - Interactions between threads and signal handling

Crucial concept: Thread Safety

- Functions called from a thread must be thread-safe
- Def: A function is thread-safe iff it will always produce correct results when called repeatedly from multiple concurrent threads.
- Classes of thread-unsafe functions:
 - Class 1: Functions that do not protect shared variables
 - Class 2: Functions that keep state across multiple invocations
 - Class 3: Functions that return a pointer to a static variable
 - Class 4: Functions that call thread-unsafe functions

Thread-Unsafe Functions (Class 1)

- Failing to protect shared variables
 - Fix: Use P and V semaphore operations
 - Example: goodcnt.c
 - Issue: Synchronization operations will slow down code

Thread-Unsafe Functions (Class 2)

- Relying on persistent state across multiple function invocations
 - Example: Random number generator that relies on static state

```
static unsigned int next = 1;
/* rand: return pseudo-random integer on 0..32767 */
int rand(void)
    next = next*1103515245 + 12345;
    return (unsigned int) (next/65536) % 32768;
/* srand: set seed for rand() */
void srand(unsigned int seed)
    next = seed;
```

Thread-Safe Random Number Generator

- Pass state as part of argument
 - and, thereby, eliminate static state

```
/* rand_r - return pseudo-random integer on 0..32767 */
int rand_r(int *nextp)
{
    *nextp = *nextp*1103515245 + 12345;
    return (unsigned int) (*nextp/65536) % 32768;
}
```

Consequence: programmer using rand_r must maintain seed

Thread-Unsafe Functions (Class 3)

- Returning a pointer to a static variable
- Fix 1. Rewrite function so caller passes address of variable to store result
 - Requires changes in caller and callee
- Fix 2. Lock-and-copy
 - Requires simple changes in caller (and none in callee)
 - However, caller must free memory.
 - That's what is done with Unix buffered I/O (e.g., printf)

```
/* Convert integer to string */
char *itoa(int x)
{
    static char buf[11];
    sprintf(buf, "%d", x);
    return buf;
}
```

```
char *lc_itoa(int x, char *dest)
{
    P(&mutex);
    strcpy(dest, itoa(x));
    V(&mutex);
    return dest;
}
```

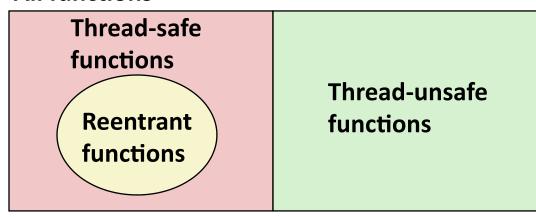

Thread-Unsafe Functions (Class 4)

- Calling thread-unsafe functions
 - Calling one thread-unsafe function makes the entire function that calls it thread-unsafe
 - Fix: Modify the function so it calls only thread-safe functions

Reentrant Functions

- Def: A function is reentrant iff it accesses no shared variables when called by multiple threads.
 - Important subset of thread-safe functions
 - Require no synchronization operations
 - Only way to make a Class 2 function thread-safe is to make it reetnrant (e.g., rand r)

All functions

Thread-Safe Library Functions

- All functions in the Standard C Library (at the back of your K&R text) are thread-safe
 - Examples: malloc, free, printf, scanf
- Most Unix system calls are thread-safe, with a few exceptions:

Thread-unsafe function Class		Reentrant version
asctime	3	asctime_r
ctime	3	ctime_r
gethostbyaddr	3	gethostbyaddr_r
gethostbyname	3	gethostbyname_r
inet_ntoa	3	(none)
localtime	3	localtime_r
rand	2	rand_r

Today

- Using semaphores to schedule shared resources
 - Producer-consumer problem
 - Readers-writers problem
- Other concurrency issues
 - Thread safety
 - Interactions between threads and signal, fork and I/O

Threads Summary

- Threads provide another mechanism for writing concurrent programs
- Threads are growing in popularity
 - Somewhat cheaper than processes
 - Easy to share data between threads
- However, the ease of sharing has a cost:
 - Easy to introduce subtle synchronization errors
 - Tread carefully with threads!
